Table of contents

- In which phase of the FA process is data analytics applied?
- How did we apply data analytics in the FA?
- How did we perform FA audit before using data analytics?
- What are the benefits of using data analytics in the audit process?

4 Types of Data Analytics

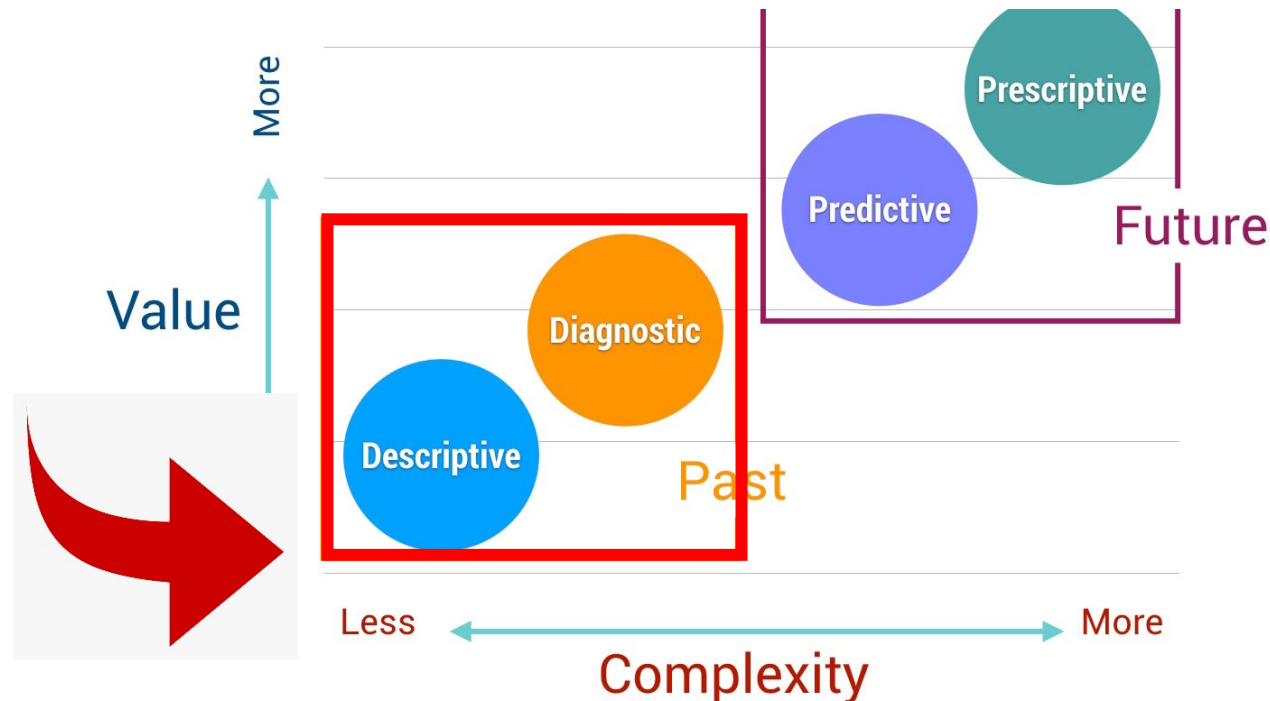

Financial Auditing

“Looks for the **past** to determine whether financial information was properly recorded and adequately supported. It also assesses whether the financial statement assertions about **past** performance are fair, accurate and reliable”

Data Analytics in Financial Auditing

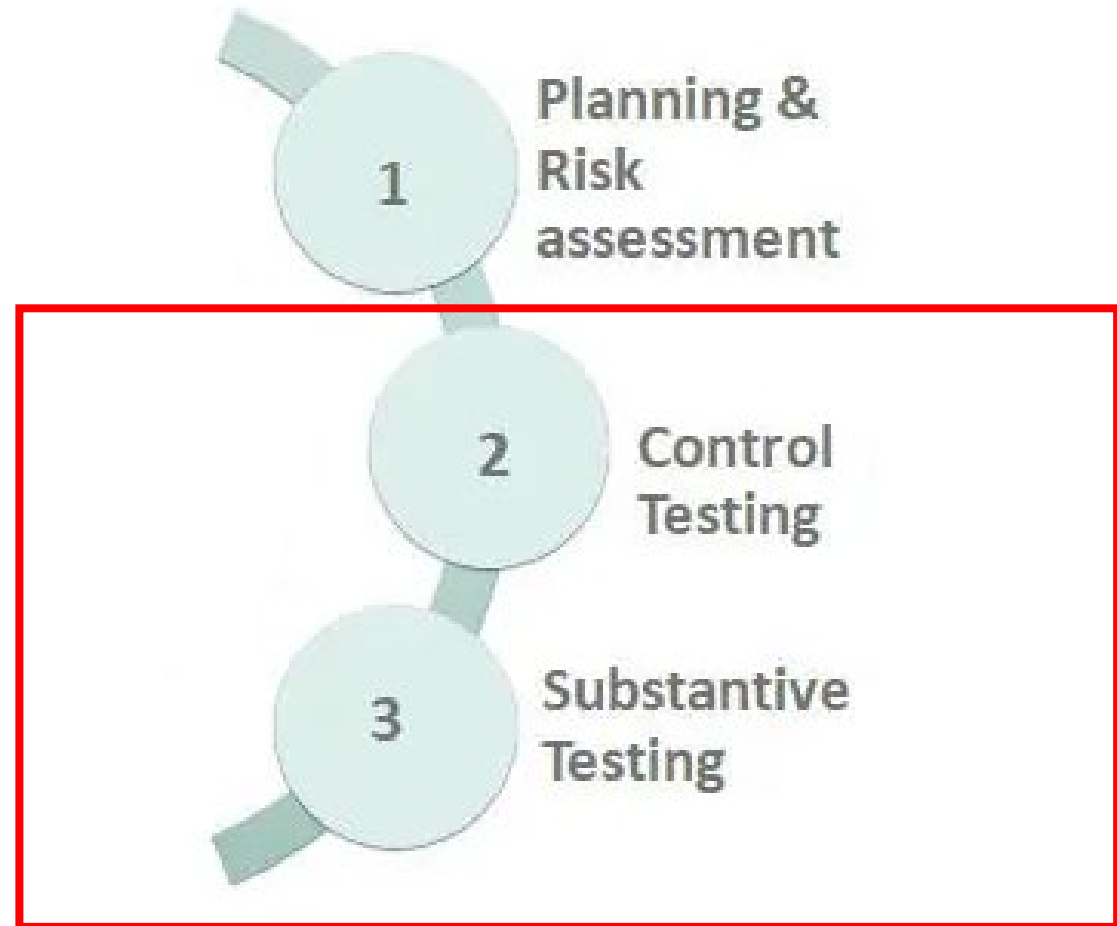

“Myth detected! As we shown in this experiment, any team could apply data analytics in financial audits.”

In which phase of the FA process can we apply data analytics?

What are the benefits of using data analytics in the audit process?

- **Achieve a very high level of assurance** – Because most data are system based, all transactions can be tested in very short time. Obtaining assurance on the entire population, rather than on a sample produces a very high-quality audit evidence.
- **Increased efficiency** – Data connections and graphical representation can be reused, opening the way for frequent risk monitoring and/ or continuous auditing.
